Transient Duplicate Record Creation in Deals Module

Severity: Informational

CWE: CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization (Race Condition) — *Context: client-side, non-exploitable*

Affected Asset:

- URL: Deals module (/dashboard/deals or equivalent create/convert action)
- Environment: Staging
- Date Discovered: 14-10-2026

Description:
During testing of create/convert actions within the Deals module, double submission of the form was observed to produce a transient duplicate deal entry in the UI. The duplicate record:

- Does not persist after a page refresh
- Cannot be operated on (no update, delete, or convert actions succeed against it)
- Does not appear in the backend or any export

This indicates a **client-side submission guard issue** rather than a server-side business logic or data integrity flaw. The backend does not create two valid records; only the frontend briefly renders a stale optimistic update.

Impact:
None identified. The issue has no security impact and does not affect data integrity, authorization, or confidentiality. It is documented as a low-priority usability observation for developer awareness.

Remediation:

- Disable the submit button immediately on first click and re-enable it only after the server response is received.
- Implement idempotency keys on the create/convert endpoint so duplicate submissions are rejected server-side, providing defense-in-depth against future regressions.
- Consider debouncing form submissions in the UI layer.

Status: Informational – not a security vulnerability; recommended for UX backlog.
